Please don't hold questions to the end.
Discussion is encouraged.

Overview

AWARENESS

THE API TOP 10

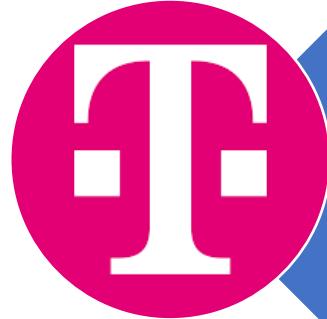

HOW DO I USE THIS?

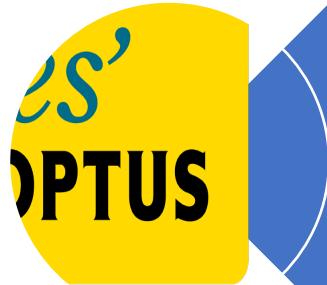

AWARENESS

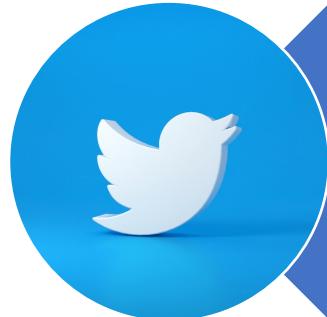

Everybody's Got A Story

Nov. 2022 T-Mobile: Hackers exploited an API to steal the data of 37M customers. They have had 8 data breaches in less than 5 years resulting in more than **\$500M** in fines and settlements.

Sept. 2022 Optus (Australian Telecom) Attackers abused a publicly exposed endpoint that didn't require authentication. They gained highly sensitive PII rich data of 10M customers. To make it easier for attackers, the API used sequential ids. Estimated financial impact was **\$140M**.

July 2022 X (formerly Twitter) exposed the PII of 5.4M user accounts. An API allowed attackers to find user accounts by providing email or phone numbers. They had to pay **\$250M** in fines for the incident.

Everybody's Got A Story (From Traceable)

60% of organizations have faced an API-related breach in the last two years and 74% of these endured three or more incidents

57% stated that traditional security solutions are unable to effectively distinguish genuine from fraudulent API activity.

61% anticipate rising API-related risks in the next two years as they deal with an average of 127 **third-party API connections**, with just 33% confident in managing external API threats.

Why do you
like APIs?

What's important to
developers?

Why do you

Authentication & Authorization

We're #1

#1 Broken Object
Level Authorization

#2 Broken
Authentication

#3 Broken Object
Property Level
Authorization

#5 Broken
Function Level
Authorization

#6 Unrestricted
Access to Sensitive
Business Flows

Attacks on
Confidentiality

Broken Authentication

Attackers can compromise passwords, keys or session tokens, user account information, and other details

Systems are unlikely to be able to distinguish attackers from legitimate users

No Brute Force Controls, Leaking Auth Details, Weak Auth Standards, Poor Validation, Weak Encryption

What can we do about it?

Broken Authentication Prevention

Know the program auth flows

Know how your auth mechanisms work

Treat recovery endpoints like login

Require re-auth for sensitive operations

Implement account lockout controls

Broken Authentication Prevention

Use Multi Factor Authentication when possible

Don't use API Keys for user authentication

Use anti brute force /cred stuffing controls

Use strong encryption controls

OWASP®

Reference OWASP Authentication Cheat Sheet

Broken Authorization Symptoms

Object

Property

- Allow sensitive data to be read by the user
- Allow CRUD ops on the value of an object property

Method

“Every API endpoint that receives an ID of an object, and performs any action on the object, should implement object-level authorization checks. The checks should validate that the logged-in user has permissions to perform the requested action on the requested object.”

Function

- X can access a function that should be exposed only to Y
- Access to Admin Endpoints
- Access CRUD via change in HTTP Method
- An API endpoint is regular or admin based only on the URL

Broken Authorization

Symptoms

Object

Property

- Allow sensitive data to be read by the user
- Allow CRUD ops on the value of an object property

“Every API endpoint that receives an ID of an object, and performs any action on the object, should implement object-level authorization checks. The checks should validate that the logged-in user has permissions to perform the requested action on the requested object.”

Method

Function

- X can access a function that should be exposed only to Y
- Access to Admin Endpoints
- Access CRUD via change in HTTP Method
- An API endpoint is regular or admin based only on the URL

Broken Authorization Symptoms

Object

Property

- Allow sensitive data to be read by the user
- Allow CRUD ops on the value of an object property

Method

“Every API endpoint that receives an ID of an object, and performs any action on the object, should implement object-level authorization checks. The checks should validate that the logged-in user has permissions to perform the requested action on the requested object.”

Function

- X can access a function that should be exposed only to Y
- Access to Admin Endpoints
- Access CRUD via change in HTTP Method
- An API endpoint is regular or admin based only on the URL

Broken Authorization

Symptoms

Object

Property

- Allow sensitive data to be read by the user
- Allow CRUD ops on the value of an object property

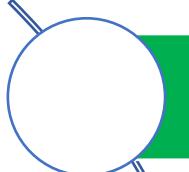

“Every API endpoint that receives an ID of an object, and performs any action on the object, should implement object-level authorization checks. The checks should validate that the logged-in user has permissions to perform the requested action on the requested object.”

Method

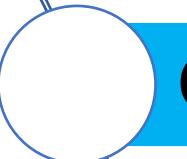

Function

- **X can access a function that should be exposed only to Y**
- Access to Admin Endpoints
- Access CRUD via change in HTTP Method
- An API endpoint is regular or admin based only on the URL

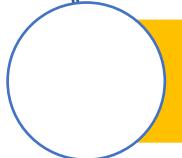

Broken Authorization Prevention

Use Proper Authorization Mechanisms

Check Access for Every DB Action

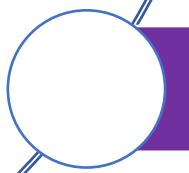

Use Random and Unpredictable GUIDS

Test Authorization Functionality for ALL Roles

Deny Access to Sensitive Data By Default

Inherit Admin Authorization Checks from Abstract Controller

API Abuse

Authorized Access

Unsanctioned
Use

Unintended
Use

Exploiting
Vulnerabilities

Unrestricted
Access
to Sensitive
Business Flows

Identify the business flows
that might harm the
business if they are
excessively used

Choose the right protection
mechanisms to mitigate
the business risk

Unrestricted Access to Sensitive Business Flows

Intermission

Consumption & Forgery

#4 Unrestricted
Resource
Consumption

#7 Server-Side
Request Forgery

#10 Unsafe
Consumption of
APIs

Attacks on
Integrity &
Availability

Server-Side Request Forgery

Occurs when an API is fetching a remote resource without validating the user-supplied URI.

This allows an attacker to coerce the server-side application to make requests to an unintended location , regardless of WAF or VPN protections.

External Resource Access Happens Here

Webhooks

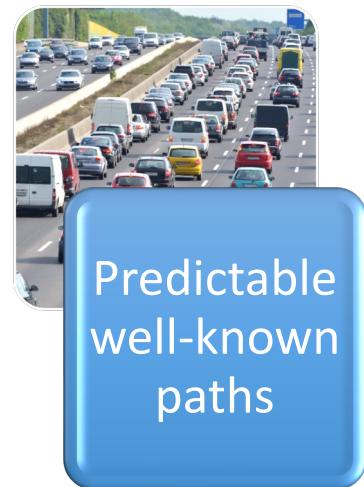

File
Fetching

URL
Preview

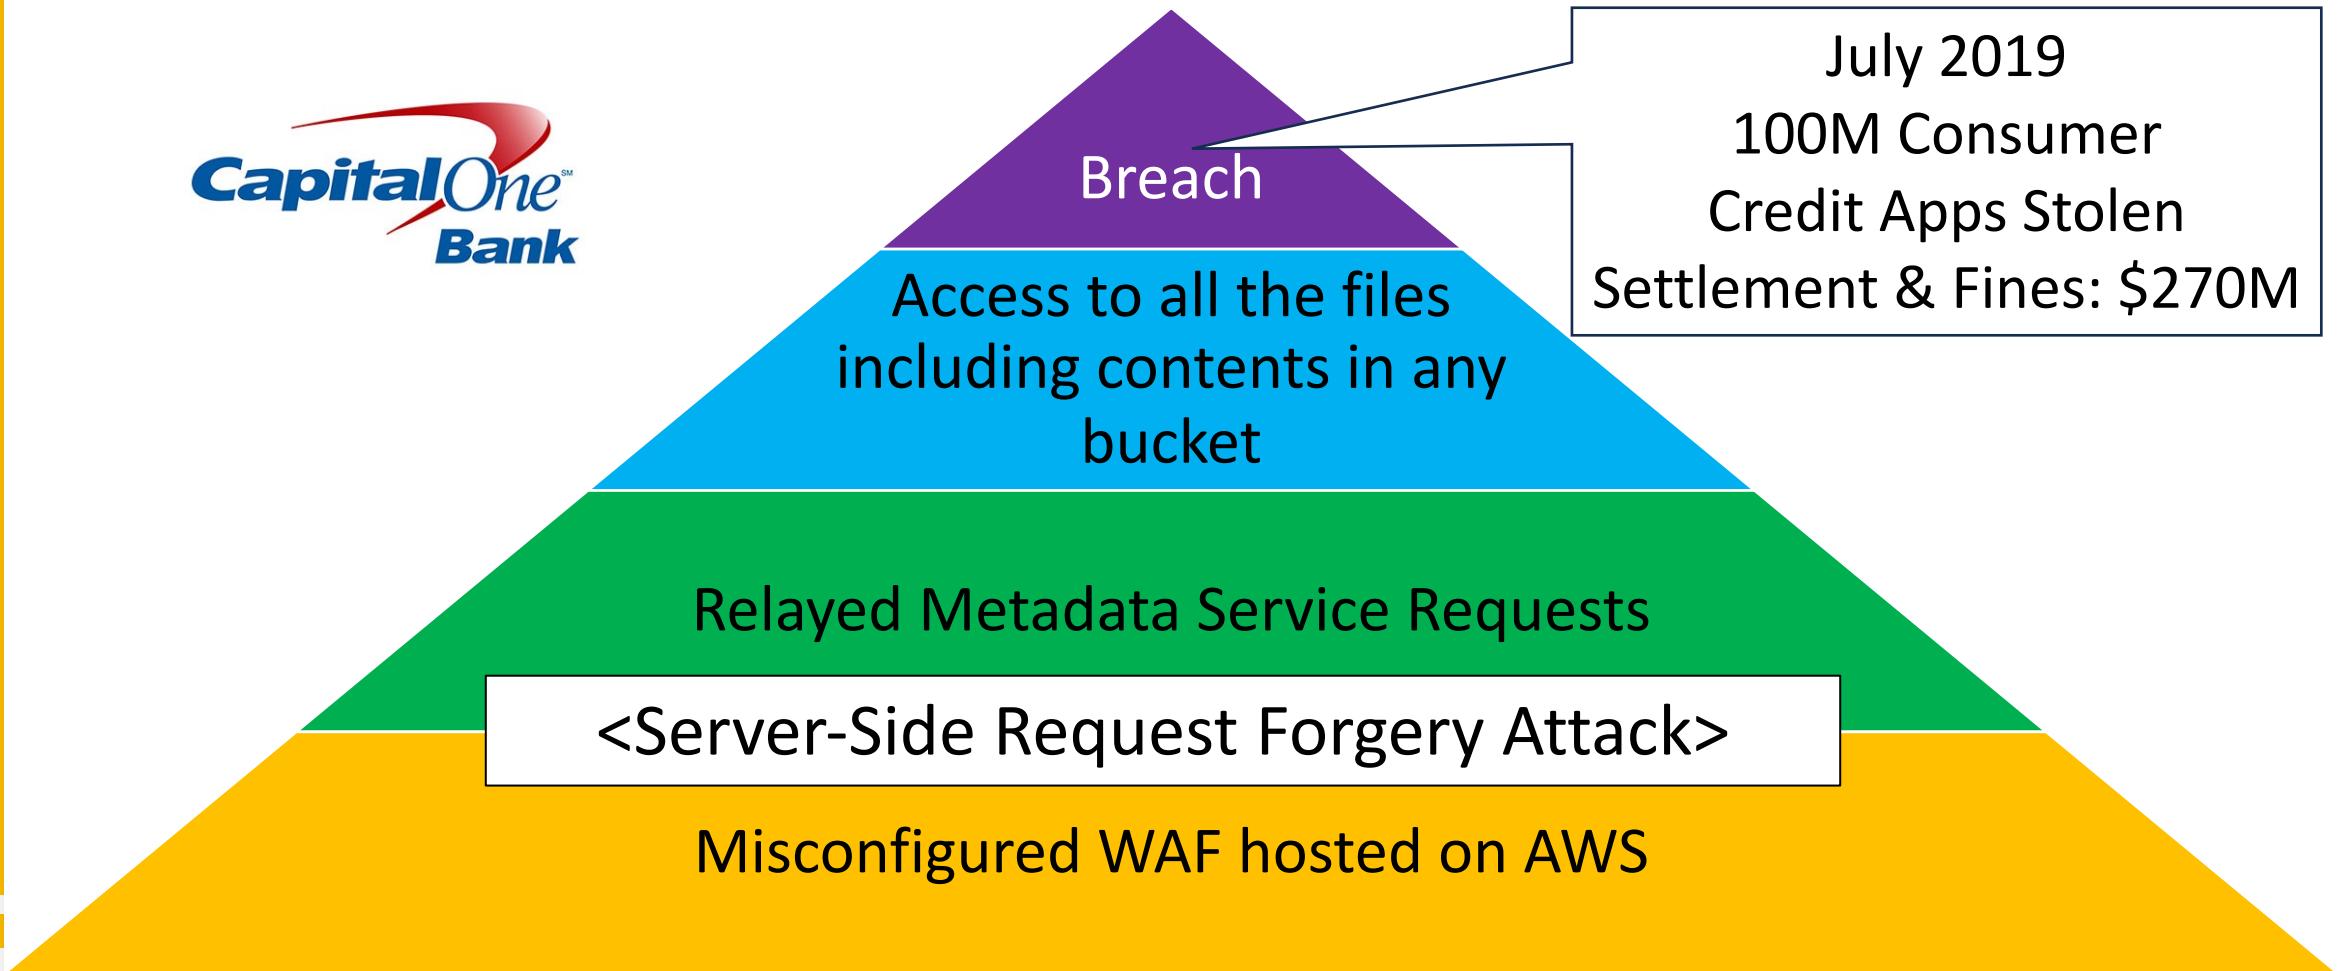

Exposed
channels
over HTTP

Predictable
well-known
paths

Server-Side Request Forgery

Server-Side Request Forgery

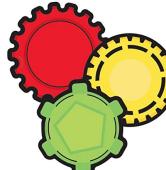

Isolate Resource
Fetching

Use Allow Lists

Disable HTTP
Redirects

URL Parser

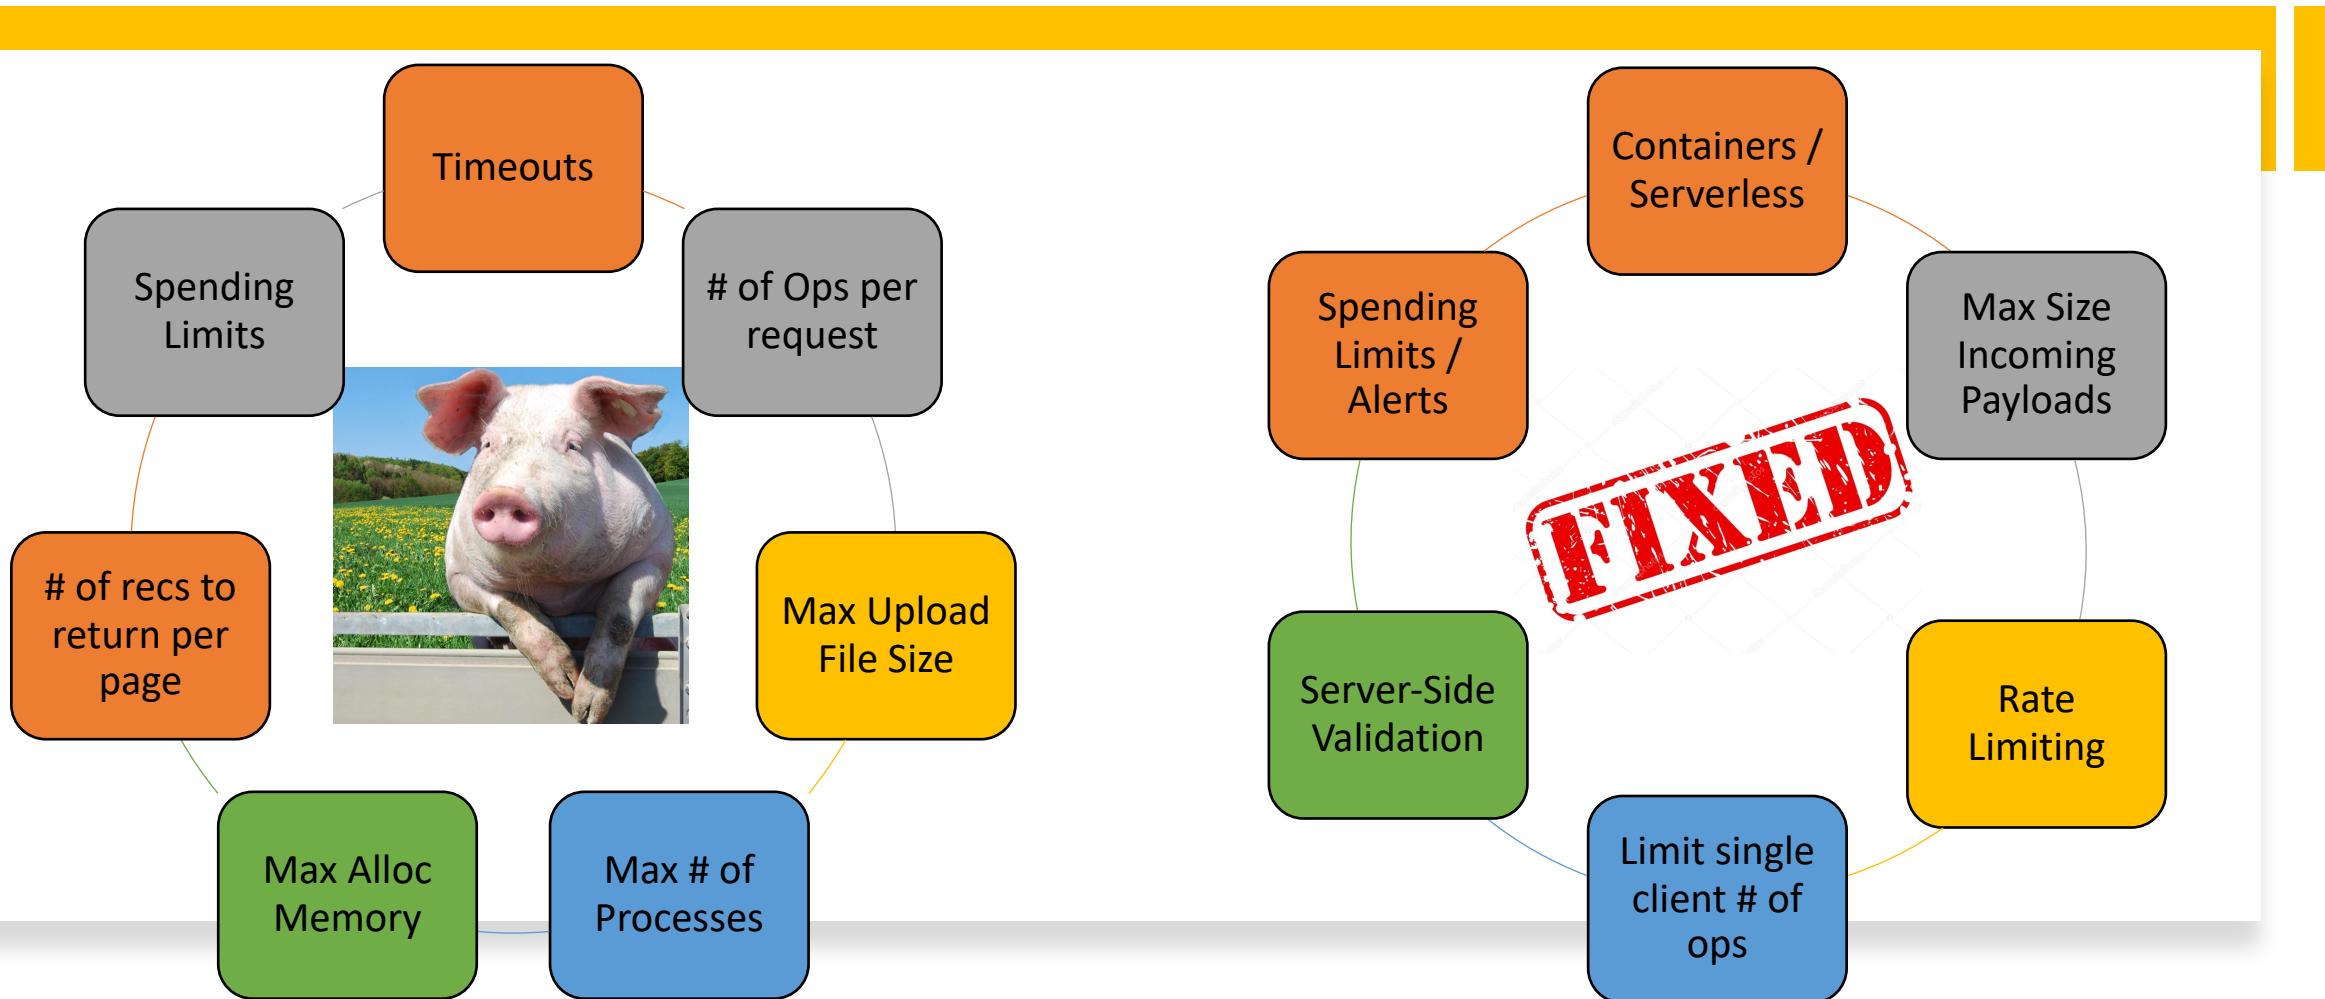

Validate Client
Supplied Data

Don't Forward
Raw Responses

Unrestricted Resource Consumption

“Here Piggy, Piggy”

Unsafe Consumption of APIs

What friends should you TRUST?

Assess 3rd party
API service
providers

Validate and
sanitize data
from other APIs

Allow list any
redirect URIs /
don't blindly
follow redirects

Use TLS

Limit resources
available to 3rd
parties

The Rest: Making Life Easier For Attackers

#8 Security
Misconfiguration

#9 Improper Inventory
Management

Attacks on
Integrity

Security Misconfig

You might be vulnerable if

- 🔒 Your error messages contain stack traces
- 🔒 You have bonus features
- 🔒 You don't use TLS
- 🔒 You aren't keeping up on patching
- 🔒 Your Cross Origin Resource Sharing (CORS) policy is missing or improperly set up
- 🔒 You are clueless about configuring your cloud
- 🔒 You don't have a repeatable, automated hardening process
- 🔒 You don't use security headers

Improper Inventory Mgmt

Sensitive Data / Dataflow Blind Spots

- ✗ No business approval or justification
- ✗ No inventory or visibility
- ✗ No visibility of what data is being shared

Documentation Blind Spots

- ✗ Where it runs?
- ✗ Who has access?
- ✗ No versioning strategy?
- ✗ Old or no documentation
- ✗ Old or no inventory data

Improper Inventory Management

Prevention

- ✓ Automation
- ✓ Security Tooling
- ✓ Inventory and Documentation
- ✓ Know Sensitive Dataflows
- ✓ Be Careful with Data in Non Prod Envs
- ✓ Version Strategy
